

How to build a fence

using Blue Circle Cement

Materials and Tools

- Blue Circle Postcrete
- Water
- Bucket
- Shovel
- Spirit level
- Tape measure
- Fence posts
- Fencing panels
- Safety gear

Step by step guide

- 1. Preparation** - Carefully mark out the locations of each post to be installed for the fence.

- 2. Dig the first Hole** - Dig the hole for the first post to at least one third of the height of the post being used and about 3 to 4 times as wide.

- 3. Check the Position** - Insert the post in the hole to double check the hole depth and width to make sure both are correct. Remove the post.

- 4. Installing the Postcrete** - Pour water into the hole until it is half full. Place the post in the centre of the hole and pour in one bag of Blue Circle Postcrete all around it until the powder reaches the top of the water surface. Hold the post firmly in place and check alignment with the spirit level as curing starts within 1-2 minutes. The post will be fully set within 5-10 minutes.

5. Fixing the panels – Once the first post has set, recheck the measurements and position for the next post hole using a fence panel. Repeat the installation process above for fixing the next and subsequent posts. Clean your tools promptly after finishing to prevent any material from hardening on them.

Finishing – Once post installations are complete, fill the holes back to surface level with soil and turf as required.
